

title: Sematext User Roles description: Inviting team members to your account means they get access to all your Apps, dashboards, notification hooks, alert rules, and everything else!

Typically you might have one person create an account by signing up. This account might be considered a *parent* account for your whole organization or team.

### **Owner**

Since the person who created the account would be its **OWNER**, this person is typically a team leader or manager, somebody with the responsibility to oversee the DevOps pipeline of the whole organization or team. They might then choose to share the whole Account with every other person from the team/organization to allow others to easily access all Apps created under that account.

### **Admin**

Some invited users might be given the **ADMIN** role, which gives them read, write, and invite rights.

### **User**

Other invitees might get the **USER** role, which mostly only grants read rights with the ability to create and edit their own Dashboards/Alerts/Subscriptions which are available to everyone under the shared account.

### **Billing Admin**

In some cases, the account **OWNER** will not be able to handle billing-related info and will want to invite **BILLING\_ADMINS** who will be able to define, edit, and delete credit cards and choose plans to be used for Apps in the account.
