title: Sematext Agents description: Sematext has several different Agents available for you to monitor your servers, cluster, applications and general infrastructure.

To start monitoring your infrastructure you need to set up the appropriate Sematext monitoring agent. You can choose from:

- Sematext Agent, a lightweight, blazing fast Go-based Monitoring Agent with a tiny footprint for both infrastructure and containers. It also collects metrics for various integrations using App Agents. App Agents can also instrument JVM-based apps to collect transaction traces and perform on demand profiling.

- Node.js-based App Agent, which can monitor Apache, Nginx (including Nginx Plus), Express.js, and Node.js of course.
