title: Logagent input plugin for Cloud Foundry description: Logagent features modular logging architecture framework where each input or output module is implemented as a plugin. Plugin recieves logs from Cloud Foundry log drains via HTTP. The Sematext SaaS and on-premises platform works well with container-based architecture, and provides logging and monitoring tools for variety of private cloud distributions and public cloud instances, developer frameworks, application services, and more.

Input Plugin: Cloud Foundry

Recieves logs from Cloud Foundry log drains via HTTP.

Please note:
To ship Cloud Foundry application logs to Sematext Logs, we recommend to stream Cloud Foundry application logs directly to Sematext Logs

Configuration

```
input:
  # Receive data from Cloud Foundry log drains via http
  cloudFoundry:
    port: 8888

output:
  stdout: yaml
```

Start Logagent

```
logagent --config myconfig.yml
```
